Touchstone 5: Client Website Final Project

- North Star Bakery Website
- Taufiq Uddin
- Client: North Star Bakery
- Live Website:
- **https://abidhussain2330.github.io/north-star-bakery-touchstone-3/**

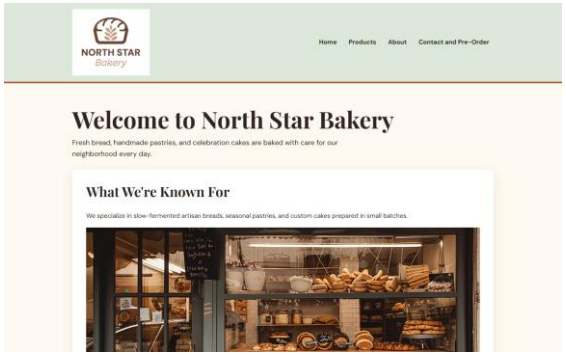

Client Goals & Audience

- Client Goal: Promote a neighborhood bakery and encourage pre-orders and inquiries.
- Target Audience: Local customers, commuters, families, and event planners.
- Design Choice: A clear Contact and Pre-Order navigation link appears on every page.

Site Structure & Content

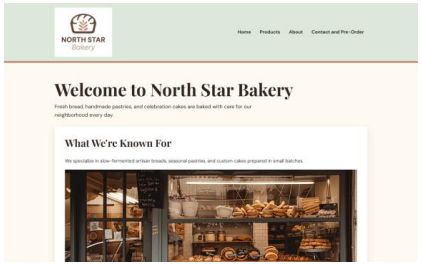

- Pages: Home, Products, About, and Contact and Pre-Order.
- Navigation: The shared header keeps the same links on every page.
- Structure: One H1, clear headings, and grouped cards help customers scan quickly.

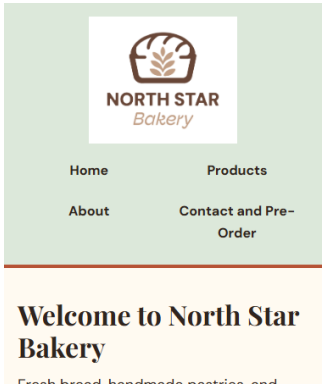

Desktop homepage: branding, navigation, and grouped content

Visual Design System

- Color: Cream, dark ink, sage, and terracotta create a warm, high-contrast palette.
- Typography: Playfair Display distinguishes headings; DM Sans keeps forms readable.
- Layout: Mobile-first cards and responsive images create a clear single-column mobile flow.

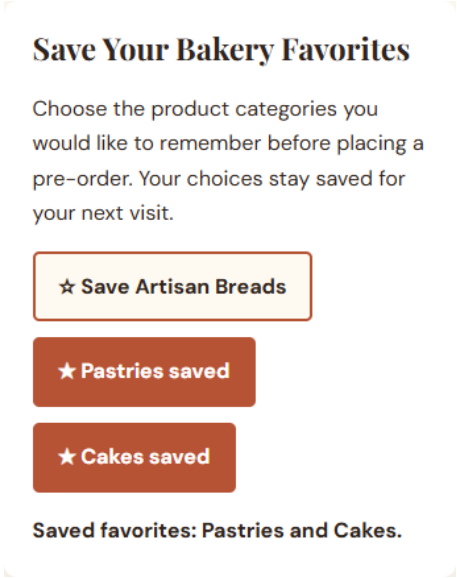

Desktop and genuine 375px mobile homepage views

Interactive Feature

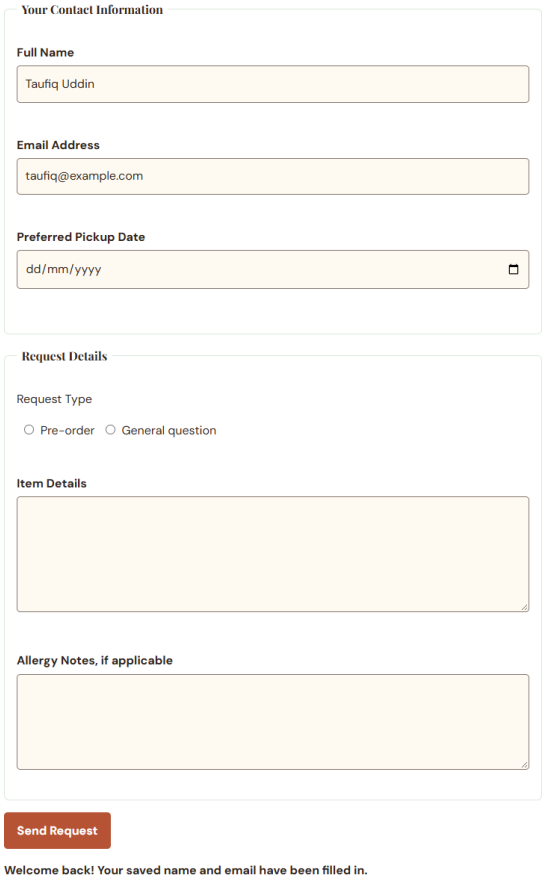

- Feature: Save Your Bakery Favorites remembers product categories.
- User Action: Click a category button, such as Save Pastries.
- Result: The button changes to a saved state and a live message confirms the selection.

Pastries and Cakes selected with an immediate status update

Data Storage

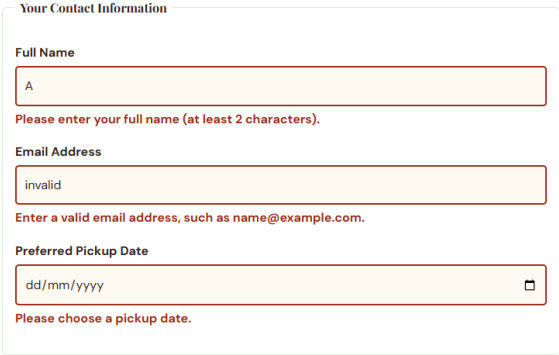

- Storage: localStorage.
- Saved: Favorite categories plus a customer's name and email after valid local demonstration input.
- Timing: Button clicks save favorites; validation saves and restores contact details.

Restored contact details after reload

Accessibility

- Verified features: Skip link, semantic landmarks, descriptive alt text, visible keyboard focus, form labels and fieldsets, and aria-live validation feedback.
- Focus: Field-specific feedback is announced beside the relevant input.

Field-specific feedback with visible error states

Self-Evaluation

- Strength: The site combines a consistent visual system with clear task-focused interactions.
- Evidence: The Contact and Pre-Order form shows specific errors while preserving entered information.
- User Impact: Customers know exactly what to fix and can return more quickly because their name and email are remembered.
- Improvement: Add a real server-side order system so valid requests can be securely delivered and confirmed.

Process Reflection

- Planning: I planned four audience-focused pages, shared navigation, accessible forms, and a warm bakery visual system early.
- Change: I added saved favorites and remembered contact details after identifying repeat customers as a key user need.
- Why It Changed: The interactive elements make returning to products and starting another inquiry faster.

Challenges & Lessons Learned

- Challenge: Browser-native validation did not provide consistent, nearby feedback for every field.
- Solution: I used JavaScript validation functions, dedicated error elements, aria-live messaging, and tests for invalid and valid data.
- Lesson: Plan validation feedback as part of the interface, not as an afterthought.
